Introduction:

Estradiol is a white or milky white odorless powder. It is soluble in and acet, slightly soluble in ethanol, and insoluble in water. Estradiol is the intermediate between estradiol valerate and estradiol benzoate. It can be used to treat uterine functional bleeding, primary amenorrhea, menopausal syndrome, and prostate cancer.

Estradiol is a therapeutic agent. Supplement the lack of 17-beta estradiol secreted by the female ovaries, while avoiding side effects caused by oral administration (breast pain, weight gain, hypertension, gallstones and abnormal liver function).

Estradiol is important in the development and maintenance of female reproductive tissues such as the mammary glands, uterus, and vag during puberty, adulthood, and pregnancy. It also has important effects in

many other tissues including bone, fat, skin, liver, and the brain. While estradiol levels in men are much lower compared to those in women, estradiol has important roles in men as well. Aside from humans and other mammals, estradiol is also found in most vertebrates and crustaceans, insects, fish, and other animal species.
